1. Game Overview

LAST SECOND is a 3D single-player exploration/puzzle game where players enter mysterious environments, discover objectives, solve simple challenges and escape before time runs out. The game features five short levels connected through a shared progression, with each location offering its own atmosphere, interactive elements and surprises.

2. Core Gameplay

The game begins with a main menu containing PLAY, SETTINGS and QUIT. PLAY leads to a short rules/briefing screen followed by a central hub containing five doors.

Level loop: Choose door → 60-second timer starts → Explore → Find required object / solve puzzle → Use bonus time when needed → Unlock exit → Complete level.

Three successfully completed levels are required to reach the ending.

3. COMIC • TWIST • LIGHT — Theme Integration

Theme	Game Implementation
COMIC	Humorous environmental details, absurd and meme-inspired objects, playful character interactions, comedic visual moments and funny feedback
TWIST	The five doors initially appear to lead to separate challenges, but recurring visual and environmental clues gradually reveal a connection between
LIGHT	Lighting is used to shape atmosphere, guide exploration and highlight important areas, while approachable puzzles, readable environments and

All three required themes are implemented directly through gameplay, environmental design, interactions, presentation and progression rather than being used only as visual labels.

4. Time-Based Gameplay

Each level begins with a 60-second base timer. Players may discover bonus-time objects that provide additional time (+5s, +10s or +20s). These objects introduce a risk-versus-reward decision: spend time searching for extra time or continue directly toward the objective and exit.

TIME IS LIMITED • EVERY SECOND MATTERS • CHOOSE YOUR NEXT MOVE

5. Five Levels / Team Ownership

Level	Owner	Deliverable
1	Bhavya	Map + puzzle + bonus-time objects + exit
2	Shivansh	Map + puzzle + bonus-time objects + exit
3	Anwar	Map + puzzle + bonus-time objects + exit
4	Samarth	Map + puzzle + bonus-time objects + exit
5	Anany Sharma	Map + puzzle + bonus-time objects + exit

Each member designs one independent level concept and map while following the shared timer, objective, bonus-time and exit framework.

6. Level Structure

- Each level is a compact 3D map with obstacles, interactive objects and one primary objective.
- The player must find a required key/object or solve the level's main puzzle.
- The final gate/exit becomes available only when the required condition is satisfied.
- Bonus-time objects can extend the timer when collected.
- Failure occurs when the timer reaches zero before the level is completed.
- Three successfully completed levels are required to reach the ending.

7. Twist & Ending

The five levels contain small recurring visual or environmental clues. These clues gradually suggest that the doors are connected. As the player progresses, the clues build toward a final reveal that recontextualizes the journey and gives the earlier levels a larger meaning.

“You made it. But the journey was never what it seemed.”

8. Unity Technical Scope

System	Purpose
GameManager	Global game state and progression
MainMenuManager	Menu + inactivity timer
TimerManager	60-second timer + bonus time
LevelManager	Load levels + completion tracking
DoorManager	Five-door level selection
BonusTimeManager	Bonus-time object availability and collection
Objective / Exit Manager	Required object, exit and completion logic
UI / Player Systems	HUD, interaction and 3D movement

9. Development Plan

Finalize five level concepts and rough map layouts.

Build and stabilize the shared movement, timer, doors, objectives, bonus-time and transition systems.

Prototype and integrate each member's level independently.

Strengthen the comic and light presentation across all levels.

Implement recurring clues, the connected-level twist and ending.

Playtest and balance each level around the 60-second limit.

Optimize the project and prepare the final playable build and public GitHub repository.

10. Submission Requirements

The final submission will be a playable Unity game demonstrating all three required themes — COMIC, TWIST and LIGHT — through gameplay and presentation. The public GitHub repository will contain the project and the required proposal PDF. Every team member's name, email and IndieConnect ID will be included in the proposal.

Team Validation: The team must be a member of an official team thread in the TCG Game Jam Discord server for the submission to be considered valid.

11. One-Line Pitch

“A light-hearted 3D puzzle game where every second matters, every location hides a surprise, and the biggest twist is why you were there.”
